

Based on the principle that if two messages are XORed with the same key, XORing them will be yield the same result as XORing their respective ciphertexts.

1. XOR the two ciphertexts given above together
2. Using the result, check all of the given plaintext codewords against each location within the ciphertext (e.g. check from 0-2 with OUR, then 3-5, etc.)
NOTE: Clever players will notice that the flags begin with SVBGR{. This can be used to obtain more of the message.
3. Pick through the resulting candidates and determine which ones are sensible (look as though they could be part of a legitimate flag) and which ones are not, using the sensible ones to repeat the above process, generating a partial flag.
4. By XORing the partial flag and the result from 1, you can obtain a partial message (some words/letters mixed in with random XOR results).
5. Going back and forth between these two should allow you to determine the correct words used in the flag/message.

The flag is SVBGR{LIGHTING_UP_THE_MEN_IN_BLACK} and the accompanying message is OUR ULTIMATE PLAN WILL BE REVEALED!
